

Task 1 - Web App QA & Debug Report

Candidate name: Gargi Anil Bhanagre

Target Application: realworld.io

1. Bug Report Table

#	Title / Summary	Steps to Reproduce	Expected vs Actual	Severity	Suspected Cause
1	Missing Frontend Validation on Signup Password	1. Go to register page. 2. Enter a 1-character password. 3. Click Sign Up.	Expected: UI blocks submission and warns user. Actual: UI allows submission and crashes on raw API error.	Medium	Frontend lacks character length validation checks before triggering the network API request.
2	Broken Profile Image URL Fallback Handling	1. Go to Settings. 2. Put a broken or invalid link in Profile Image URL field. 3. Save and view profile.	Expected: Renders default fallback profile avatar. Actual: Displays broken image icon, ruining page header layout.	Low	Image <code>onError</code> handler is missing a default placeholder asset mapping in the frontend UI profile layout.
3	Lack of Authentication Route Guarding	1. Log in. 2. Copy the active <code>/settings</code> URL string. 3. Log out. 4. Paste that URL back into browser address bar.	Expected: Redirects unauthenticated session to <code>/login</code> . Actual: Renders an empty white screen with unhandled JavaScript runtime console errors.	High	React/Angular router configuration lacks a protected route wrapper layout to evaluate active session states.
4	Raw Backend Server Error Leak on Duplicate Signup	1. Attempt to register a new account using an email address that already exists in the database. 2. Submit form.	Expected: Renders a clean user-friendly alert message. Actual: Displays unformatted, raw 422 JSON error payload code directly onto the UI.	High	The frontend application fails to properly catch and parse the backend server's error exception array objects.

5	Brand Typography Accessibility Contrast Failure	1. Open home page. 2. Observe green banner tags or buttons using browser developer inspection tools.	Expected: Meets minimum contrast text safety levels. Actual: Text fails readable contrast limits on smaller mobile viewports.	Low	The default application stylesheet uses a light green brand asset hex code with insufficient background color contrast.

2. Root-Cause Analysis (Issue #4)

During user registration validation testing, inputting an email address that already exists in the database returns a raw 422 Unprocessable Entity payload from the backend server. The web application frontend fails to properly catch and parse this exception response within its network communication wrapper layer. Consequently, the user interface displays raw database system errors directly to the end user instead of a clean error alert. This exposes internal system structural logic and creates a confusing user experience that feels broken. To resolve this issue, developers must introduce an asynchronous try/catch error handling block inside the signup form's submission function. The caught response error array must be mapped to local user interface state fields, allowing the application to display a clean, user-friendly notification banner near the email input box.
